

Lull — handoff, design pass 2

October 7, 2026. Continues `Handoff-2026-10-06.md` (the ChatGPT design pass and TestFlight build 1).

Founder direction unchanged: ages 2–6, all nine toys (Meadow and Hum stay), warm tactile shelf, Apple Design Award quality bar.

Where the work is

- GitHub: `interventionbluecamo-afk/lull`.
- `main` (`c919d04`) is the TestFlight build 1 source, copied in from the ChatGPT checkpoint folder (`~/Documents/ChatGPT/New project/LullReviewCheckpoint/WarmShelfToybox`).
- This pass is on branch `claude/modest-bell-cjarqm`, two commits on top of `main`:
 - `9727fc9` Drop Dots seating, Sleepy Box posting, art despill tool.
 - `b10749e` Feed counter, Meadow cohesion.

- To try it on the Mac, in Terminal:

```
cd ~/Desktop/"lull v.2"
git fetch origin
git checkout claude/modest-bell-cjarqm
```

Then open `WarmShelfToybox/Lull.xcodeproj` and build. To go back: `git checkout main`. Don't edit the ChatGPT checkpoint folder in parallel; the GitHub copy is now the source.

Honest verification status

- Every changed Swift file passes the Swift 6.1 syntax parser (`swiftc -parse`).
- It has **not been compiled against iOS** (the work ran on Linux with no Xcode). Type errors are possible; build in Xcode before anything else. If a build error appears, paste it.
- Layouts were checked with offline mocks that reproduce the code's math using the real PNGs (`Assets/DesignPass-02/* .png`). They are not screenshots of the running app.
- No gesture, sound, rotation, VoiceOver or device test was run for this pass.

What changed

Feed — the counter (founder: "table not matching up visually")

Problem: one thin plank floated mid-screen; the friend's round bottom and a cream key patch poked out under it; the food hung off the plank's front face; a big empty floor sat below. Now (`FeedScene.swift`, `CharacterNode.swift`):

- The child is the shopkeeper. A deep counter runs from the table line to the bottom of the screen, built from the authored plank: its top face cut into board strips with staggered seams, and its front edge as the near lip (`buildShopCounter`, `CounterArt`).
- Friends stand behind the far edge, seen chest-up. The counter hides exactly the bottom 30% of each painted figure (`standHeight(hidingBottom:)`). Tall friends tuck lower rather than clip on short landscape screens (`paintedHeadroom`).
- Every food stands on its own wooden plate (`feed-pedestal`) on the countertop, well below the friend's mouth. Fresh food rises from under the counter onto its plate.
- Landscape phones: smaller food and friend (food was a third of the screen tall).

- The first-time hint points at the wanted food.
- Mock: Assets/DesignPass-02/feed-counter-before-after.png, feed-counter-portrait-landscape.png.

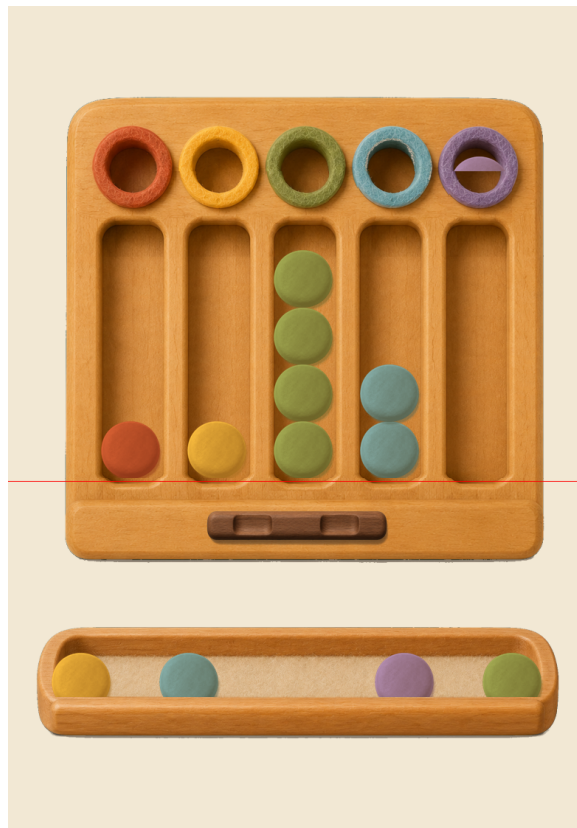

Feed: today (left) and the new shopkeeper counter (right). Offline mock from the real art.

Drop Dots — dots drop in correctly (founder: "drop in incorrectly")

Problem (measured on the art): the bottom dot sat half a dot below the painted channel floor, on the rail; the rings sit on a wider pitch than the channels, so outer dots landed on channel walls; dots drew over the felt rings, the rail and the tray; two handles; a heavy dark pad under every played dot; a moon carving that read as a letter C. Now (DropDotsScene.swift, board/coin art):

- Dots rest on the painted floor and in the middle of the painted channels (channelFx).
- The board is sized to the stack, so a full column of four looks full.
- A dropped dot sinks into its ring, passes behind the wood and appears in its channel; the pour slides behind the rail; tray dots stand in the trough behind its front lip.
- One handle: the knob baked into the rail is painted out; the walnut pull sits on the rail and pours on release or a short pull, never on touch-down (a resting palm can't empty it).
- Plain clay coins (dropdots-token-blank), light resting shadow.
- Mock: Assets/DesignPass-02/dropdots-seated.png.

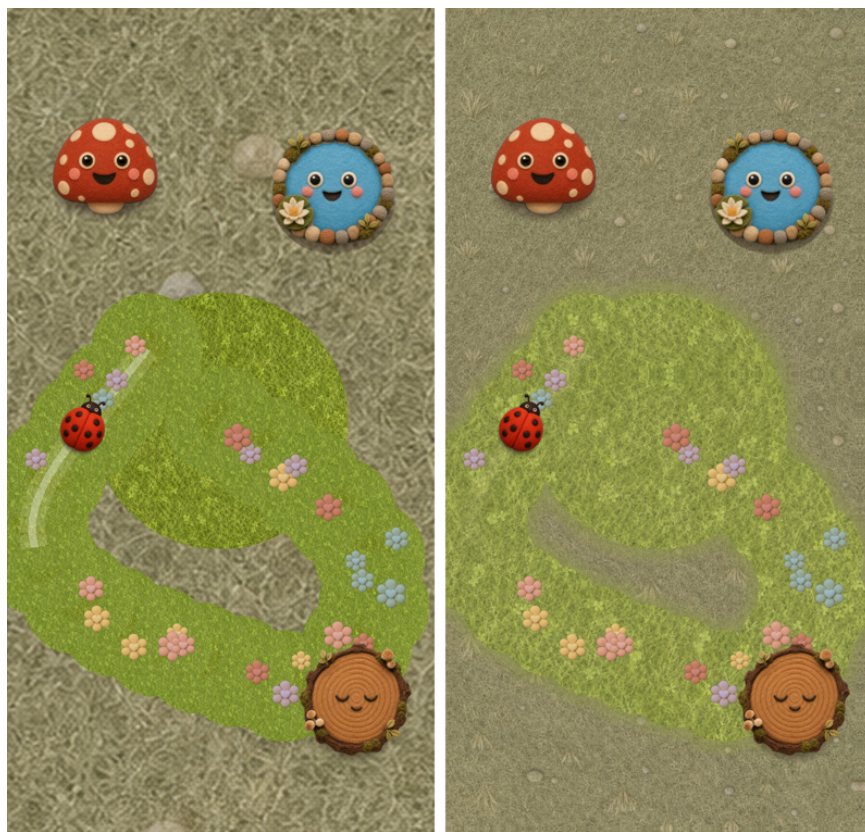

Drop Dots: dots seated on the painted floor, centred in the channels, one handle, dots inside the tray.

Sleepy Box — posting

A posted shape is clipped to its socket outline and slips back into the dark behind the rim, instead of shrinking to a dot in front of the box (dropPiece).

Meadow — visual cohesion (founder: "cool but could use some visual cohesiveness")

- Ground and moss are tiled at their painted resolution (they were stretched ~5× into blur).
- Spring is one world-aligned moss surface revealed where the ladybug walks, with a soft felt edge and muted colour, instead of hundreds of re-stretched moss circles with rings.
- Honest coverage drives the warm glow and the full-bloom moment (pacing kept); node count no longer grows forever.
- The camera stops at the world edge; the white "highlighter" trail is gone; flat vector tufts no longer sit on the felt; side-view landmarks aren't spun; one warm shadow each.
- Mock: Assets/DesignPass-02/meadow-before-after.png.

Meadow: stretched ground and stamped moss circles (left) vs. native-resolution felt and one soft spring surface (right).

Art pipeline

- `Tools/Art/despill.py`: turns the teal key-background shadow and fringe into a soft warm shadow. Applied to Meadow and Drop Dots art (before/after: `Assets/DesignPass-02/despill-before-after.png`). Don't run it blindly on art that is meant to be dark blue-green (night trees, skies).
- New art drop folder tracked by Git: `ArtDrops/2026-10-07/`.

App icon (proposal, not shipped)

Directions at real sizes: `Assets/DesignPass-02/icon-directions.png`, `icon-moon-in-sky.png`.

Recommendation: the sleepy stone at dusk, with the moon moved off the belly into the sky, built as Icon Composer layers (background, stone) so the light, dark, clear and tinted appearances work. Prompts:

`Docs/ArtPrompts-2026-10-07.md` §1.

Icon directions at 60, 40 and 29 pt on light and dark wallpapers. Recommended: B (dusk).

Test on device first (this pass)

1. **Feed**, portrait and landscape: friend chest-up, nothing below the counter, plates under each food, food returns to its plate on a miss, fresh food rises from below, the bubble doesn't clip, and the mouth target still works.
2. **Drop Dots**: dots land on the floor in the channel middle; four in a column fill it; dots vanish into the ring and reappear in the channel; tap the handle → pour behind the rail into the tray; a palm resting on the handle and sliding off does not pour; rotation keeps the board.
3. **Sleepy Box**: post each shape; it should slip into its hole and not draw outside it.
4. **Meadow**: crisp ground; painting looks like one soft surface; walking to the world edge never shows background; the bloom moment still arrives after about a minute of leading; rotation keeps the garden; frame rate stays smooth after several minutes of painting; first-frost dandelion clears and re-seeds the home garden.

Still open (from the October 6–7 audits)

- **Feed**: wrong food gets the same happy bite as the wished one; no chew beat; no idle life (yawns, re-invites); higher-resolution friends (prompts §3).
- **Drop Dots**: random colours make the "three in a row" glow rare and the full-board song impossible with five dots; a rainbow-sort payoff (each dot in its own colour column) would fit ages 2–3; a notched rack instead of the trough; landscape tray light direction.
- **Sleepy Box**: confirm on device whether ChatGPT's rebuild fixed the edge-clipped ball and star, the iPhone-landscape layout and the face legibility; no idle breathing or wind-down.
- **Window**: ChatGPT fixed the dial tap, wall pan and silent sky taps; still open: ~1,000 lines of dead code and art from the removed toys, see-through stretched frame art, the peek-a-boo bird hidden behind the trees.

- **Mix-Up:** the Queen art is a byte copy of the King (the "King repeats" bug; three other characters are copies too), the yellow buttons look like video play buttons, the matched bow almost never fires, landscape portraits steal taps.
- **Not yet audited:** Stack, Bubbles, Hum, the shelf room (the audit hit the usage limit).
- **Before external testing / App Store:** privacy-policy link in the grown-up area, a real support address, StoreKit product setup, the trial model (local 7-day trial resets on reinstall; Apple guideline 3.1.1 expects a \$0 non-consumable for timed trials), the grown-up check (single-digit sums are passable by 4–5-year-olds), timer policy.

Apple Design Award checklist (what a jury will notice)

- One coherent material world in every toy (the Meadow/Feed/Drop Dots work moves toward this).
- A layered icon with dark and tinted appearances.
- Accessibility: VoiceOver on every toy, Dynamic Type and real switches in the grown-up area, Reduce Motion paths that keep cause and effect.
- No dead ends, no silent touches, no clipped art in any orientation or device size.
- The ending ritual: the app gets sleepy rather than cutting play off.

Continuation prompt

Continue Lull from GitHub `interventionbluecamo-afk/lull`, branch `claude/modest-bell-cjarqm` (two commits on top of main, the TestFlight build 1 source). Read `WarmShelfToybox/Docs/Handoff-2026-10-07.md` and `Handoff-2026-10-06.md` first. Build in Xcode and fix any compile errors from this pass before anything else (it was syntax-checked only). Then run the device checks in the handoff. Keep ages 2–6 and all nine toys. Next work, in order: the open Feed loop items (kind "not that one", chew beat), the Mix-Up duplicate cast art, the Drop Dots rainbow sort, then audit Stack, Bubbles, Hum and the shelf. Wire any new art from `ArtDrops/` using `Tools/Art/despill.py`. Keep usage in reserve and leave a handoff.
